

## CODE-DRIVEN TESTING

**\_focus\_**  
Completion of the contract  
as defined by the test

## REFACTORING

**\_focus\_**  
Alignment of the design  
with known needs

## TEST-DRIVEN DEVELOPMENT

# TDD Tips & Tricks

- Avoid unit tests for trivial getters/setters
- Don't test language builtins
- Use a standard variable name for your instance under test; e.g., `testObj`
- Start with a `testInitialize`, that checks construction post-conditions
- Look very carefully at the dependencies and seams in your code - as you'll likely need to inject dependencies (Test doubles) so that your tests can run in isolation
