# GitOps

As specified by the CNCF

## What is GitOps?

GitOps is a set of principles for operating and managing software systems. Under GitOps, the infrastructure and application state are fully represented by the contents of a Git repository. Thus, any changes to the Git repository are reflected in the corresponding state of the associated infrastructure and applications through automation. The desired state of a GitOps managed system must be:

- **Declarative**

A system managed by GitOps must have its desired state expressed declaratively.

- **Versioned and Immutable**

Desired state is stored in a way that enforces immutability, versioning and retains a complete version history.

- **Pulled Automatically**

Software agents automatically pull the desired state declarations from the source.

- **Continuously Reconciled**

Software agents continuously observe actual system state and attempt to apply the desired state.
