Development Environment Setup

We welcome our Robot overlords!

Our build automation approach

We have normalized our automation approach across
all of our example projects. This enables newcomers
to jump into a project and make contributions quickly,
as they only need to learn the automation entry points.

The following have been set up for you

- Sample projects in Java, dotnet, Python
- Basic automated Unit and Acceptance tests
- CI Build automation and result publishing
- Static security analysis via CodeQL
- Secret scanning
- Automated dependency scanning
  (security and currency)
